A COMPARISON OF THE KODALY METHOD AND THE TRADITIONAL
METHOD TO DETERMINE PITCH ACCURACY
IN GRADE 6 CHORAL SIGHT-SINGING

A thesis submitted in partial fulfillment of the

requirements for the degree of

MASTER OF SCIENCE

in

MUSIC EDUCATION

by

Merissa Amkraut

2004

To: Dean R. Bruce Dunlap
College of Arts and Sciences

This thesis, written by Merissa Amkraut, and entitled A Comparison of the Kodaly Method and the Traditional Method to Determine Pitch Accuracy in Grade 6 Choral Sight-Singing, having been approved in respect to style and intellectual content, is referred to you for judgment.

We have read this thesis and recommend that it be approved.

Deborah Burton

Greg Martin

Carolyn Fulton, Major Professor

Date of Defense: November 23, 2004

The thesis of Merissa Amkraut is approved.

DEDICATION

I dedicate this thesis to my parents and my brother, Ross. Without their patience, support and most of all love, the completion of this work would not have been possible.

ACKNOWLEDGMENTS

I wish to thank the members of my committee for their support and patience. I certainly appreciate their guidance and support throughout this journey. Dr. Greg Martin's willingness to join my committee has been most appreciated. Dr. Deborah Burton was kind enough to give me insight into analyzing great music. Finally, I would like to thank my major professor, Dr. Carolyn Fulton. From our first meeting, she believed in my ideas and my work ethic and encouraged me during difficult times. I truly appreciate her time, effort and friendship.

I have found my coursework throughout the Music Education program to be stimulating and educational, providing me with the necessary tools to become a Master Educator.

ABSTRACT OF THE THESIS

A COMPARISON OF THE KODALY METHOD AND THE TRADITIONAL METHOD TO DETERMINE PITCH ACCURACY IN GRADE 6 CHORAL SIGHT- SINGING

by

Merissa Amkraut

Florida International University, 2004

Miami, Florida

Professor Carolyn Fulton, Major Professor

The purpose of this study was to determine which of the two methods is more appropriate to teach pitch discrimination to Grade 6 choral students to improve sight-singing note accuracy. This study consisted of three phases: pre-testing, instruction and post-testing. During the four week study, the experimental group received training using the Kodaly method while the control group received training using the traditional method. The pre and post tests were evaluated by three trained musicians. The analysis of the data utilized an independent t-test and a paired t-test with the methods of teaching (experimental and control) as a factor. Quantitative results suggest that the experimental subjects, those receiving Kodaly instruction at post-treatment showed a significant improvement in the pitch accuracy than the control group. The specific change resulted in the Kodaly method to be more effective in producing accurate pitch in sight-singing.

Chapter 1

INTRODUCTION

Research Problem

Grade 6 chorus is the beginning level of continued music study. It is often considered the culmination of musical concepts learned in elementary general music. The Sunshine State Standards provided to teachers includes reading and notation of music as a basic concept for Grade 6. Standard MU.A.3.3.1 states, “the student sight reads music in the bass and/or treble clefs written in simple and compound meters.” This standard is solely an end result and there is not a suggested, uniform approach given to teachers as to which method will produce better intonation, the Kodaly method or the traditional method. Choral teachers are not instructed to use a particular teaching method for sight-singing. This research will measure the results of two different method of learning to determine the better approach to teaching correct pitch discrimination in sight-singing.

Need for the Study

This study is significant to the field of music education because teachers need to have a better understanding of the methodology associated with teaching sight-singing to sixth graders. Teachers are expected to have their performing groups participate in annual Music Performance Assessments in the area of sight-singing. This study will provide data that will aid choral teachers in determining which method is more suitable. Teachers must explore both the Kodaly method and the traditional method to determine which produces better results. This study will measure both methods and provide data that can be used by

other teachers who may have difficulty teaching pitch accuracy in sight-singing to sixth graders.

Chapter 2

LITERATURE REVIEW

Introduction

The research done for this review involves the study of both the Kodaly method and the traditional method when used as a teaching strategy in a Grade 6 Choral class. Sight-singing will be used as the assessment activity for determining the best method.

Pitch

The term “pitch” as defined in Songworks I: Singing in the Education of Children refers to the dimension of sound that we describe as relative highness or lowness. Seeing pitches notated on a staff conditions us to think of them as moving up and down, being higher and lower than each other (Bennett and Bartholomew, 1997). Teachers should clearly define the terms used to describe pitch movement such as high and lower and up and down. Bennett and Bartholomew continue to say that the concept of vertical distance and movement is the conventional way of thinking about pitch. In their research, they included an example of an activity to use when teaching children to determine pitch movement. A melody graph can be made by having students connect the written notes with a line. A line is a good visual representation of the changing directions and relative distances between the pitches of a melody (see Appendix A).

Rote Learning

Teaching music by ear, without the use of notation is known as the rote approach. This method, which has been used successfully by teachers who can read music as well

as by those who cannot, has been a useful, but limited strategy for teaching music at all levels for many generations. Rote teaching is done through teacher modeling and student observation and imitation (Bennett and Bartholomew, 1997). Reading music is neither necessary to nor sufficient for being a musician; however, lack of music-reading skills limits the extent to which we can independently investigate unfamiliar material or literature. The advantage of rote learning is that teachers can continue to make music with students by teaching songs, guiding aural and vocal skills, stimulating interest in music and accomplish all these tasks effectively, without recourse to music reading (Bennett and Bartholomew, 1997).

Traditional Method

The traditional method can be described as a combination of rote learning and modeling. The traditional method involves teaching without overt reference to musical concepts (Apfelstadt, 1984). In a descriptive study by Johnson (1988), he found that the interval approach was most frequently used and although most of the choral educators agreed with a philosophy of music literacy, relatively little time was devoted to sight-singing. In this study, the use of pitch direction and intervallic note relationship will serve as the traditional teaching method.

The Kodaly Method

The Hungarian composer, Zoltan Kodaly (1882-1967) based his philosophy of music education on singing. The Kodaly technique asserts that singing is the foundation for broad musical literacy (Howard, 1996). Kodaly believes, “the human voice is an instrument provided by nature and is one that almost everyone can develop.” In a study

by Howard, he states that instruction in the Kodaly method should continue until the student is competent in the essentials of musicianship: sight-singing, dictation, ear training, part-hearing, harmony, form, and memory. In addition, Howard's research suggests that the incorporation of these concepts into the instructional classroom will provide better understanding of fundamental concepts improving the student's musicianship. Another study done by DeVries discusses the advantages of having Kodaly-based music programs in elementary schools. Kodaly-based music programs are formed around Kodaly's belief that 1) true music literacy—the ability to read, write and think music— is the right of every human; 2) music learning must begin with the voice; 3) the education of the musical ear must begin in primary grades if it is to be successful; 4) music skills and concepts necessary for musical literacy should be taught with folk music of the mother tongue; and 5) only music of unquestioned quality— both folk and composed should be used (DeVries, 2001). In DeVries' research he reevaluates the use of Kodaly and his experiences with using this method in his own elementary teaching. DeVries states, "Anyone who has taught a Kodaly-based music program will know just how successful it can be. From week to week, children's singing—particularly pitch improves; rhythmic skills improve significantly from year to year; music literacy develops; and children can perform music in increasingly complex parts."

Hand signs are physical gestures that represent solfa (Bennet and Bartholomew, 1997). Solfa syllables (also referred to as solfège or solfeggio) are used to teach young students the relationships between tones. The two main varieties of solfa are the fixed *do* and moveable *do* system. In the moveable *do* system, the syllables represent only the pitch relationships. Hand signs for this system originated in the late nineteenth century

with John Curwen. Curwen created the hand signs as a way of showing the tones of the moveable *do* system (Bennett and Bartholomew, 1997). Kodaly borrowed the hand signs and emphasized their use in music education in Hungary. Many American music teachers have been using these hand signs in classrooms since the 1960s. According to Bennett and Bartholomew (1997), solfa syllables are preferable in teaching sight-singing for three primary reasons:

- 1) Solfa syllables are logically supported with hand signs (See Appendix B).
- 2) The vowel sounds of the solfa syllables are more compatible with good vocal production than those of the number system.
- 3) Numbers are used for many other purposes. In musical situations, they are used for meter, identifying measures, counting rhythms and names chords. Solfa syllables are better to use because they solely apply to the study of pitch relationships (p. 133).

Henry and Demorest (1994), investigated to determine the factors that contribute to sight-singing achievement in high school choirs. They distributed questionnaires regarding their music background and were given sight-singing exams. One group was taught using moveable *do* and the other group was taught using fixed *do*. Results showed no significant difference in achievement between the two groups. The answers from the questionnaires found that students with previous piano instruction achieved better sight-singing results (Henry and Demorest, 1994). In a descriptive study by May (1993), moveable *do* was the reading system used by 82.30% of the respondents and that 76.56%

reported that they rehearsed melodic sight-reading between 30 and 36 weeks of the school year.

Sight-singing

Sight-singing technique can be developed on an informal, functional basis. During rehearsals, sight-singing functions as a whole-part guideline teaching both rhythm and pitch. Various patterns in music can be pointed out so that the students gain a concept that is transferable from one piece to another (Bennett and Bartholomew, 1997). When teaching sight-singing, teachers often rely on the use of the piano. Kodaly believed that voices are best accompanied by other voices and that we learn to sing better in tune when we match a voice to another voice rather than to an instrument (Choksy, 1988). In order to help students achieve musical independence from the piano, a sight-reading system that give singers a tool with which to approach the music needs to be selected (Guelker-Cone, 1998). Guelker-Cone states that there are a range of systems available to teachers; however, the moveable *do* system, with a *do-do* scale for major keys and a *la-la* scale for minor keys has a number of advantages if it is used consistently. It should also be noted that Kodaly was an advocate of the moveable *do* system. She continues to say that students should be involved in reading choral music as soon as possible. The Kodaly method uses a number of activities to teach students to understand pitch relationships in order to be able to later read music. In Guelker-Cone's study, she clearly states the advantages of using the moveable *do* system over the fixed *do* system. The moveable *do* system highlights the harmonic function of each note in a scale. The recurring function of these syllables serves as an aid for sight-singing and composition analysis. The introduction of a sharp or flat alters the rhythm of the note in the number system. Instead

of saying “*do, di, re, ri...*” students using the number system or traditional method say, “one, sharp-one, two, sharp-two...” Students need to start practicing vocalises on moveable *do* syllables in order to develop an aural understanding of each syllable’s relationship to other pitches (Guelker-Cone, 1998). In Henry’s study (2001), she developed a vocal sight-reading inventory assessment tool that represents the skills involved in vocal sight-reading (Henry, 2001). She found that there was no sight-reading test available that a) represents fundamental pitch skills incorporated in most choral literature and sight-reading text-books; b) accommodates time constraints of secondary choral music directors; c) provides formative and summative evaluation information to teachers, students, and parents; and d) provides validity, reliability, or morning data. The Vocal Sight-Reading Inventory developed in this study was informed by the finding of previous research and addressed questions raised by that research (Henry, 2001). Previous research confirmed the need for a strong vocal context for musical examples. Henry used scale patterns including *do* to *mi*, *do* to *sol*, or *do* to *do* because each begin and end within the same harmonic function. In her study, a percentage success rate was determined by dividing the number of pitches performed correctly by the number contained in the test. No significant difference between forms was found for 22 of the 28 pitch skills. In another study by Belmondo (1987), two different methods of tonal music reading instruction for high school choral students were compared. The methods were based on Edwin Gordon’s theory of hierarchical levels of learning. The subjects were split into high and low aptitude groups based on their scores on the Tonal Imagery section of Gordon’s Music Aptitude Profile (Grant and Norris, 1998). When tested on familiar major and minor tonal patterns, no significant differences were found for either

treatments or aptitude levels. However, they found that when tested on unfamiliar patterns, significant differences between high and low aptitude students in the control group existed (Grant and Norris, 1998).

Chapter 3

METHODOLOGY

Subjects

Participants for this study attend a middle school in south Florida. The subjects were two intact classes of Grade 6 choral students aging in range from 11-13 years. One class was the experimental group and the other class was the control group. The experimental group consisted of 39 students (3 boys and 36 girls). The control group had a total of 41 students (6 boys and 35 girls). A total of 80 sixth grade students took part in the study.

Procedure

This study consisted of three phases: pre-testing, instruction and post-testing and took place over four weeks. The first procedure of this study included a pre-test administered to both the experimental and the control group. The investigator administered the sight-singing test to both groups. The pre-test, based on the findings of Henry's investigation (2001) of the Vocal Sight-Reading Inventory (VSRI) consisted of diatonic scale passages with no altered tones. Students sang the example using "loo" syllable (without the use of Curwen hand signs). The pre-tests were audio recorded onto a mini-disk. An independent samples t-test was used to check for equivalence between the two groups. During the instructional phase (a four-week period), the experimental group received training using the Kodaly method, including hand signs and moveable *do*. The control group received training using the traditional method or numeric scale degrees and

pitch direction to determine which notes to sing. Sight-reading instruction for both groups consisted of two fifteen-minute lessons per week. Since this middle school functioned on a rotating block schedule, students met every other day for two hours. The sight-singing training was implemented during the first fifteen minutes of class (See Appendix C). At the completion of the four weeks, the same test based on the Vocal Sight-Reading Inventory was given to the experimental and control group as a post-test.

Analysis

Three different forms of assessment were used to analyze the data. Pre-test and post-test scores were analyzed by a panel of three trained musicians to score for accuracy. The mode of the three evaluators was used in the statistical analysis. A paired samples t-test was used to analyze the number of correct notes on the post-test and the pre-test. An independent samples t-test was done on the difference of the post-test and the pre-test to determine if pitch accuracy improved after four weeks of sight-reading instruction.

Chapter 4

RESULTS

Three evaluators (all music teachers) were asked to evaluate each student's pitch accuracy. The judges listened to two performances of the students. The performances were randomized so that the judges could not identify which one was the pre-test and which one the post-test. They were asked to count the number of correct pitches heard. The maximum score was twenty-four correctly identified notes.

Two different forms of assessment were used to analyze the data. A paired samples t-test was conducted to measure whether students got a greater number of correct score on the post-test than on the pre-test. Also, an independent samples t-test was conducted on the difference of the post-test and pre-test to determine if pitch accuracy has improved among students after four weeks of instruction.

Analysis of Data

Prior to evaluating the data, an independent samples t-test was used to check for equivalence of the two groups. Table 1 compares the pre-test scores for each group.

Independent Samples T-Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pre-test	Equal variances assumed	.355	.553	1.625	78	.108	.777	.478	-.175	1.730
	Equal variances not assumed			1.621	76.289	.109	.777	.480	-.178	1.733

Table 1- Comparison of pre-test scores to check for equivalence among both the experimental and control groups.

The results indicated that, prior to instruction, there were no significant differences between students in the experimental group and students in the control group.

The investigator collected each answer given by students in the pre-test as well as the post-test. A paired samples t-test was conducted to evaluate and compare the students' improvement of pitch accuracy in sight-singing. Table 2 summarizes and compares the results of this investigation.

Paired Samples T-Test

		Paired Differences				t	df	Sig. (2-tailed)	
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower				Upper
Pair 1	Pre-test - Post-test	-8.282	4.668	.747	-9.795	-6.769	11.081	38	.000

Table 2- Paired Samples T-test of pre-test vs. post-test scores

Upon completion of four weeks of instruction, there was significant improvement in the number of correct notes sung among students from the experimental group. For the experimental group, the mean correct on the post-test (M=17.72, SD= 4.489) was significantly greater than the mean correct on the pre-test (M=9.44, SD= 2.245). There were no significant differences between the means of the total correct on the pre-test vs. the total correct on the post-test for the control group. The experimental group improved more than the control group. Table 3 compares the pre-test vs. post-test scores by group.

Paired Samples T-Test: Experimental Group

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	Pre-test	9.44	39	2.245	.360
Experimental	Post-test	17.72	39	4.489	.719

Paired Samples T-Test: Control Group

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1 Control	Pre-test	8.66	41	2.032	.317
	Post-test	9.41	41	2.607	.407

Table 3- Paired samples t-test scores by group

An independent samples t-test was then conducted to compare the difference of the post-test scores minus the pre-test scores. Table 4 summarizes the results of this test.

Independent Samples T-Test (on the difference)

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Difference	Equal variances assumed	7.390	.008	8.780	78	.000	7.52595	.85716	5.81947	9.23243
	Equal variances not assumed			8.677	61.849	.000	7.52595	.86733	5.79209	9.25982

Table 4- Independent samples t-test on the difference of the post-test vs. the pre-test

Based on the findings of the study, considerable evidence exists that the Kodaly training given to the experimental group produced a noticeable improvement in pitch accuracy during sight-singing activities.

Chapter 5

DISCUSSION

The term “pitch” is widely used in music education every day. This dimension of sound can be related to the highness or lowness of notes. During this investigation, pitch was evaluated using a sight-singing assessment activity over a four-week period of time in which two different teaching methods were used. This investigation concludes with the statement that students instructed using the Kodaly system (with the Curwen hand signs) improved significantly in pitch accuracy while students who received instruction using the traditional teaching method (rote learning) showed no significant improvement. The findings in this study concur with the findings of DeVries, Guelker-Cone and Grant and Norris.

While instructing the sixth grade students, it was observed by the researcher that the group receiving training using the Kodaly method and hand signs could see and feel the movement of the pitches (high and low). The students receiving traditional rote instruction or echo singing had difficulty understanding the concept of high and low since no visual or physical experience occurred.

This study was limited to four weeks of instruction. A similar study could be conducted in the future to compare the pitch accuracy in sight-singing after an entire academic year (approximately thirty-six weeks) to determine improvement over a longer period of time. Teachers in south Florida can learn from this particular study since sight-singing is a requirement for grade 6 choral students. Perhaps going beyond the scope of this study, future studies will confirm the best teaching method to achieve maximum results in pitch accuracy and the long-term efficacy of the Kodaly method.

Conclusions

As a result of the findings generated by this study, the following conclusions were inferred.

1. Students who received training using the Kodaly method achieved a greater significant advantage over students who received traditional instruction with regard to pitch accuracy in sight-singing activities.
2. Melodic perception of pitch can be acquired as a result of Kodaly training.

This study was significant to the field of music education because there is a constant search for effective teaching methods. Educators should be made aware of the effects of each method so that students receive a high quality and effective music education. Based on the findings of this research, it was concluded that the Kodaly method tested in this study is an effective and valuable tool to aid in the pitch accuracy development in grade 6 choral sight-singing.

Example B

Sight-Singing Lesson Plan Week 2

Day 1	DATE:	Day 2	DATE:
Objective:	<ol style="list-style-type: none"> Students will be able to recognize scale movement. Students will be able to sight-sing an example containing “skipping” intervals of root, 3rd and 5th and scale motion. 	Objective:	<ol style="list-style-type: none"> Students will be able to determine scale movement and in which direction (up or down). Students will be able to accurately sing scale movement from do-la or scale degrees 1-6.
Focus: <i>do, re, mi, fa, sol</i>		Focus: <i>do, re, mi, fa, sol, la</i>	
Materials: Example C		Materials: Example D	
Activities: Kodaly	<ol style="list-style-type: none"> Teacher writes solfège on the board in contour notation for “Example C”. Teacher introduces and models hand sign for new note <i>sol</i>. Students sing “Example C” contour notation using “hmm” and correct hand signs. Teacher sings the song through using solfège. Students sing the song using solfège and correct hand signs. 	Activities: Kodaly	<ol style="list-style-type: none"> Teacher will explain that there is a new note. Students will sing example using solfège and sing “hmm” for new note. Teacher will model hand sign for new note “la”. Students will give hand signs for “Example D” while teacher sings using solfege. Students will sing using “hmm” while doing hand signs. Students will sing “Example D” using hand signs and solfège syllables.

Activities: Traditional	<ol style="list-style-type: none"> 1. Teacher writes contour notation on the board “Example C” using circles. 2. Teacher introduces new note 5 and explains that it is one note above 6. 3. Students sing “Example C” contour notation using “hmm”. 4. Teacher sings the song through using scale degree numbers while students track each note. 5. Students sing the song using numbers. 	Activities: Traditional	<ol style="list-style-type: none"> 1. Teacher will explain that there is a new note. 2. Teacher will draw melody graph showing pitch direction for “Example D”. 3. Teacher will explain that new note “6” is higher than 5. 4. Students will echo-sing “Example D” using “loo” 5. Students will sing “Example D” using numbers. 6. Students will identify measures that have upward and downward scale motion.

Example C

Whist - le, Daugh-ter, whist - le, and you shall have a cow.

Example D

Sight-Singing Lesson Plan Week 3

Day 1	DATE:	Day 2	DATE:
Objective:	<ol style="list-style-type: none"> Students will be able to sing <i>do, re, mi, fa, sol, la, ti</i> while reading music notation. Students will be able to visually recognize and sing repeated notes. Students will be able to identify pitch direction of notation 	Objective:	<ol style="list-style-type: none"> Students will be able to sing <i>do, re, mi, fa, sol, la, ti</i> while reading music notation. Students will be able to identify pitch direction of notation
Focus: <i>do, re, mi, fa, sol, la, ti</i>		Focus: <i>do, re, mi, fa, sol, la, ti</i>	
Materials: Example E		Materials: Example F	
Activities: Kodaly	<ol style="list-style-type: none"> Teacher explains that <i>do</i> is the given note in each example. Teacher models hand sign for <i>do, re, mi, fa, sol, la, ti</i>. Students do “Example E” using only hand-signs while teacher plays pitches on piano. Students sing example on “loo” syllable using hand signs. Students sing example using solfège syllables and hand signs. 	Activities: Kodaly	<ol style="list-style-type: none"> Review sound (on piano) and pitch direction for <i>do, re, mi, fa, sol, la, ti</i>. Explain use of <i>ti</i> below root and as pitch seven Teacher introduces hand signs for <i>ti</i> above head. Students echo sing as teacher sings <i>do, re, mi, fa, sol, la, ti</i> patterns using hand signs (improvisation). Teacher gives starting pitch for <i>do</i>. Students sing example on “loo” syllable using hand signs. Students sing Example F using solfège and hand signs.

Activities: Traditional	<ol style="list-style-type: none"> 1. Teacher explains that “one” is the given note in each example, followed by 2, 3, 4, 5, 6, 7 2. Teacher explains that the notes on the staff can be sung by “connecting the dots”. 3. Read through “Example E” and determine whether notes move up or down or stay the same. 4. Students look at “Example E” and point out repeated notes and notes that move up or down. 5. Teacher plays example one line at a time on piano while students track music for repeated notes. 6. Students sing example on “loo” syllable. 7. Students sing example using numbers. 	Activities: Traditional	<ol style="list-style-type: none"> 1. Review sound (on piano) and pitch direction for <i>do, re, mi, fa, sol, la</i>. 2. Teacher explains use of 7 below root and as pitch seven above root. 3. Review sound (on piano) and pitch direction for note 1 (given), 2,3,4,5,6,7. 4. Teacher plays first note and has students read through using numbers (spoken). 5. Teacher explains pitch direction for new notes. 6. Teacher plays example on piano while students track music. 7. Students sing example on “loo” syllable. 8. Students sing example using numbers.

Appendix D

Components of the Vocal Sight Reading Inventory

Components of the Vocal Sight-Reading Inventory

Henry, Michele (2001) *Bulletin of the Council for Research in Music Education*

Examples of component pitch skill patterns

The image displays six musical staves, each illustrating a different component pitch skill pattern. The patterns are as follows:

- Staff 1:** repeated, asc *arm*, desc *arm*, asc *armf*, desc *armf*
- Staff 2:** asc *armf*li, desc *armf*li
- Staff 3:** I skip, I leap, octave, V skip, V leap, V⁷ skip, V⁷ leap
- Staff 4:** IV skip, IV leap, ii skip, ii leap, vi skip, vi leap
- Staff 5:** end on d, i d, s d, s l i d
- Staff 6:** raised f, flat m, upper chromatic, lower chromatic

Appendix E

Pre and Post Test

Plans for administering Pre and Post-test

1. Teacher will distribute the test paper to each student.
2. Teacher will remind student to observe quarter, half and whole notes.
3. Student will clap through example before singing to resolve any rhythm questions. Since rhythm is not going to be evaluated, teacher will review any errors, if any, due to rhythm.
4. Teacher will press play on mini-disk recorder.
5. Teacher will say, "This is student number ___"
6. Teacher will give student starting pitch with Major chord.
7. Teacher will give two measures of 4 counts to set tempo.
8. Teacher will keep a steady 4/4 beat throughout example using a drum pad.
9. Student will sing example on "loo" syllable.
10. Papers will be collected by the investigator.
11. Tabulation of scores will be determined by three trained musicians after all pre and post tests have been recorded. Student numbers will continue 1-80 for pre and post tests.
