Figure S1: Nitrate ( $\text{NO}_3^-$ ) concentrations at the downstream sites BA-1 (size = 22.9 km<sup>2</sup>) and BA-2 (size = 8.7 km<sup>2</sup>) as a function of the concentrations measured at CC-4 clear-cut catchment during 2008-2011. Significant linear relationships were found for the entire dataset (not shown) and the dormant season (shown in figure), whereas no such relationships were found for the growing season.
